

Embraer EMB120 Brasilia Update

by

Eagle

Rotorcraft Simulations

for Microsoft Flight Simulator X

Update for the Eagle Rotorcraft Simulations Embraer EMB120 Brasilia. This package contains fixes for the EMB120 that were reported to us after the release of the initial basepack.

Fixes

-Updated landing/taxi lights that will now beam close to the aircraft rather than far away (yes, the beams were there in the base release)

-Updated specular and normal (bump) maps. The normal maps had incorrect alpha channels and the specular maps were made wrong.

-Updated nosegear steering. On the base release, the nosegear only steered to the right and not left.

-Added default B350 KingAir VC. Although not correct for the EMB120, the default KingAir 350 VC is sufficient enough for this model. A proper VC for this airplane? Not sure about it since we have lots more projects we are working on.

Installation

This update requires the full installation of the EMB120 Brasilia on your computer, the package (ersemb120fsx.zip) can be obtained from Avsim, Simviation and Flightsim.com.

- 1.) Unzip the contents to a temp folder of your choosing,
- 2.) Drag the entire contents of the EMB120_Update_V11 into your EMB120 root folder,
- 3.) Click yes to overwrite.
- 4.) Done, now go flying!!!!
